

Dear Martin

We have made several changes to the network structure in order to make the network more secure. The changes that will affect you are:

1. We have replaced the REDSYSTEMS domain with a new domain, FORTRESS. As part of this, we have given you a new username and password; they are:

username: mstrauss
password: blah

You can change your password from any Windows NT/2000/XP workstation. You will also need to join your personal computer to the domain again. If you need help with any of this, just call one of us and we'll give you a hand.

2. We have replaced the email and shared calendar functions of the Exchange server with a Linux mail server and a Linux webserver running phpGroupWare. The phpGroupWare pages can be found at <https://webmail.fortress.net.au>. The email module in the phpGroupWare suite has already been set up to use the new mail server. If, however, you are using a different mail client to read your mail, the settings are as follows:

server: mail.fortress.net.au
port: 143
protocol: IMAP

Your password for both phpGroupWare and the mail server is the same as that given above for the FORTRESS domain.

3. The fileserver has been moved to a Linux server called Pluto. If you visit \\PLUTO in Network Neighborhood (or the equivalent), you will find all the data as it was on Boron.
4. Oxygen is now sitting on the bench next to the printers, functioning as a multimedia/printing/burning machine. Oxygen contains the DVD burner, so can be used to burn both CD- and DVD-writeable media. If you visit \\OXYGEN in Network Neighborhood (or the equivalent), you will find the three printers shared, as well as the MP3 folder. The scanner that is currently on the opposite desk will eventually also move onto this bench, and be accessible from Oxygen.

If you have any questions about these changes, or need any help using the new systems, give us a shout.

Martin
